

Hepatitis B Vaccination: *What You Need to Know*

Hepatitis B vaccination is cancer prevention!

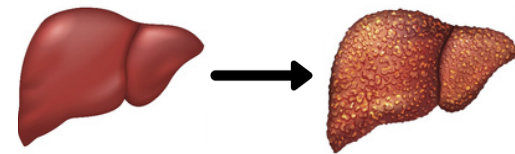

Hepatitis B is a vaccine-preventable liver infection caused by the Hepatitis B virus (HBV).

Without treatment...

1 out of 4

people with Hep B develop serious liver problems

The common mode of HBV transmission is from mother to baby.

Without HBV vaccination at birth, newborns are

90% likely to develop a chronic HBV infection throughout their lives.

Hep B is the leading cause of liver cancer in Asians Americans and Pacific Islanders.

When to Vaccinate

3 Doses

2, 3, or 4 Doses

For adults ages 18-59 that did not receive the vaccine as a baby...

Get vaccinated today to protect yourself and your loved ones!

CDC recommends universal screening of adults ages 18 years and older for HBV and for those with no record of HBV screening or those without a chronic HBV diagnosis.

Talk to your doctor about screening and vaccination for Hepatitis B virus (HBV).
