Welcome to the webinar!

Hepatitis B: Dispelling Myths and Misconceptions
Focus on Transmission & Prevention

February 21, 2019
Hep B United is a national coalition that was established by the Hepatitis B Foundation and the Association of Asian Pacific Community Health Organizations to address the public health challenge of hepatitis B.

The coalition is dedicated to reducing the health disparities associated with hepatitis B by increasing awareness, screening, vaccination, and linkage to care for high-risk communities across the United States.
Panelists

Maureen Kamischke
Social Media and Outreach Manager
Hepatitis B Foundation

Ponni Perumalswami, MD
Associate Professor of Medicine
Hepatologist
Mount Sinai School of Medicine

Amy Shen Tang, MD
Hepatitis B Program Director and
Primary Care Internist
Charles B. Wang
Community Health Center
Who is at risk for hepatitis B?
Hepatitis B Virus

The **most common serious liver infection in the world** – chronically affecting 292 million worldwide, and over 2.2 million Americans.

1 million new infections annually and 50,000–70,000 in the U.S.
Question 1: Is there a connection between hepatitis B and food?

- Is hepatitis B spread by sharing food, bowls, utensils or chopsticks?

- Can you get hepatitis B by sharing a meal with someone with HBV or eating food prepared by someone with hepatitis B?

- Is there concern with food handlers, butchers or others involved with food prep that have hepatitis B?
Question 2: Is hepatitis B genetic? How did I get this?

- Is hepatitis B carried on the sperm of a man or the egg of a woman?

- Hepatitis B seems to “run in my family.” Does my family have “weak” genes?

- How can I be the only one in my family with hepatitis B?
Question 3: Is hepatitis B transmitted through all bodily fluids?
How is it transmitted?

- Can I safely play sports or will I spread hepatitis B through contact with my sweat?
- Can I attend university or work with others without spreading hepatitis B to others?
- What sexual activities are safe with someone that has hepatitis B?
- Does having hepatitis B mean that I am somehow ”dirty” or have done something wrong?
- Are there precautions I can take to prevent transmission to others?
Question 4: I’m in love! Can I get married/be in a relationship?

- I have never had sex before. How could I have gotten this, and how will I explain this to my future partner?

- Can I marry someone without infecting them with the hepatitis B virus?

- I am married and recently learned I have hepatitis B? My spouse was tested, but is not positive. How can this be??

- Why should my partner get tested or vaccinated? Isn’t it too late?
Question 5: Can I have children without giving them hepatitis B?

- I am pregnant and learned I have hepatitis B. How can I protect my baby?

- Can my baby wait for the first shot of the pentavalent or other combination vaccine?

- Is the hepatitis B virus in breast milk? Can I safely breastfeed my baby?

- I have HBV and will soon be a father. Do I need to wait until my baby is vaccinated to hold it?
Question 6: How is the hepatitis B vaccine helpful?

- I am living with chronic hepatitis B. Will the HBV vaccine help me or even cure me?

- My partner has hepatitis B. Do you recommend an accelerated vaccine schedule, or one other than that given at 0, 1 and 6 months? Will it protect me if I shorten the schedule? Do I need a 4th dose?

- I never returned for a dose of the HBV vaccine. Do I need to restart the series?

- I am fully vaccinated. Do I need a booster shot? My blood test shows I am no longer protected!
More questions about testing and the vaccine

☐ I am from a country where hepatitis B is very common. Should I get tested first or just get the vaccine series?

☐ Is it possible for my hepatitis B positive partner to infect me even if I have completed the vaccine series? I am still afraid.

☐ Why should I bother to get tested? There is no cure and treatments are lifelong and expensive.

Understanding your hep B tests is important!

In Summary: FACTS about Hepatitis B Prevention & Transmission

- All pregnant women should be tested early to learn if they are positive for hepatitis B. Although CDC and WHO recommend that all babies be vaccinated within 24 hours of birth and complete the series, this is especially important for HBV positive women. Babies should receive the first dose of the HBV vaccine (and HBIG, if available) within 12-24 hours of birth.

- Hepatitis B is spread through direct contact with infected blood. This can occur as a result of unsafe injections, medical or dental procedures, through sexual transmission, and from an HBV positive mother to her baby during delivery. Avoid sharing items that may have blood on them like razors and toothbrushes.

- Hepatitis B is NOT spread casually. Working with, holding hands, hugging, kissing, sneezing and breastfeeding do not spread HBV.

- There is no connection between hepatitis B and any part of food preparation or sharing meals. Hepatitis B cannot be spread through sharing meals, bowls or utensils with someone who has the virus.

- The hepatitis B vaccine prevents hepatitis B transmission. The HBV vaccine does not benefit those living with or recovered from a past HBV infection. Get tested first to learn if you have a current infection or have recovered from a past infection. Follow the hepatitis B vaccine schedule and confirm protection with the anti-HBs titer test if desired. If you find you have an HBV infection, see your doctor to learn more.
